Acknowledgments

I would like to thank my boss, Mr. James H. Burrows, for offering me the opportunity to pursue a Ph.D. degree and then for allowing me the time needed to complete the work. Without Jim’s support the research described in this dissertation would not exist. I would like to thank my dissertation director, Dr. Hassan Gomaa, for his professionalism, his technical advice, and his encouragement throughout my dissertation research. Dr. Gomaa provided the human expertise underlying the expert system described in this dissertation. Having an expert at hand to discuss the human reasoning underlying various design decisions proved indispensable. I would also like to thank Dr. Mark Pullen, Dr. Dave Rine, and Dr. Bo Sanden for their suggestions and insightful comments. A special thanks is due to Dr. Sanden who insisted early in my research that I use Real-Time Structured Analysis as a starting point for my work. Dr. Sanden’s insistence on this point challenged me to solve some of the problems associated with automated reasoning about data/control flow diagrams.

I thank Dr. Anastase Nakassis who assumed my position at the National Institute of Standards and Technology during my absence to work on this research. Last, but not least, I thank my wife, Karen, and my children, Colin and Elizabeth, for allowing me to concentrate, for a while, on these less important matters.
